Daily Revenue Report

Google Sheets Automation

Stop guessing your numbers every day.

You open your spreadsheet…
Rows everywhere. Numbers everywhere.

But one simple question stays unanswered:

"Did my business actually grow today?"

That's not analysis.
That's busywork — and it's **slowing you down.**

What if your report was already waiting for you?

Imagine waking up… opening your email… and instantly knowing:

- **How much you made yesterday**
- **What products performed best**
- **Whether you're growing or dropping**

No spreadsheets.
No calculations.
No stress.

In one sentence: Turns your messy spreadsheet into a clean, automated daily revenue report sent straight to your inbox.

Why people love this

You STOP:

- Checking spreadsheets manually
- Missing important trends
- Wasting time on calculations
- Making decisions in the dark

You START getting:

- Daily revenue & orders
- Growth vs yesterday
- Full product breakdown
- Clean professional emails
- Data for real decisions

This isn't just data. It shows you:

What's growing	What's dropping	What needs attention	How you compare

So you can make smarter decisions faster — every single day.

What you get

A complete automation system — everything included:

- **Menu.gs** — control panel & setup
- **DailyReport.gs** — data processing engine
- **DailySetup.html** — easy config UI
- **DailyControl.html** — test, edit, stop anytime
- **DailyCharts.html** — interactive charts
- **DailyEmailTemplate.html** — HTML email template

Everything is ready. Just add and run.

What's inside your daily report

Metric	What it tells you
Total Revenue	Net + gross, after returns are subtracted
Total Orders	Real sales only — returns excluded automatically
Average Order Value	AOV per non-return transaction
Day-over-Day %	How yesterday compares to the day before
Product Breakdown	Revenue & orders per product or category
Returns Summary	Refund amounts and return count by product

You'll know exactly how your business performed — instantly.

⚠ Important — Read Before You Start

⚠ Do NOT rename the downloaded files

The file names are hard-coded into the script. If you rename any file, the code will break and the menus won't load.

Use these exact names in Apps Script: Menu / DailyReport / DailySetup / DailyControl / DailyCharts / DailyEmailTemplate

You must accept Google's security prompt

The first time you run the script, Google shows a warning screen. This is normal for ALL personal Apps Script projects — it does not mean the code is dangerous.

Click: "Review permissions" → choose your Google account → "Advanced" → "Go to [project name]" → "Allow"

You only do this once. Without this step the script will not run at all.

Do NOT put anything below your data table

The script reads every row below your header. Notes, totals, blank rows, or anything below your last order row will be treated as an order and skew your numbers.

Rule: Row 1 = headers. Rows 2 onwards = data only. Nothing below the last data row.

Column names must match exactly

The names you enter in the setup form must be identical to your sheet headers — capital letters and spaces matter.

Example: *"Sale Amount" is NOT the same as "sale amount" or "SaleAmount".*

HOW TO UPLOAD & ADD ALL THE CODE FILES

Follow the steps below carefully. The whole process takes about 10 minutes.

PART A — Adding the .gs Script Files

You have two script files: **Menu.gs** and **DailyReport.gs**. These are pasted directly into Apps Script. No uploading to Google Drive needed.

1 Open your Google Sheet and go to Apps Script

1. Open the Google Sheet that contains your order data
2. In the top menu bar click **Extensions** → **Apps Script**
3. A new browser tab opens — this is the Apps Script editor

> **Tip**
> You will see a default file called "Code.gs" already open. Leave it for now — you will replace its contents in a moment.

2 Paste the Menu.gs code

4. In the Apps Script editor, click the filename **Code.gs** on the left sidebar
5. Select **ALL** existing text in the editor (Ctrl+A on Windows / Cmd+A on Mac) and delete it
6. Open the downloaded **Menu.gs** file on your computer with Notepad (Windows) or TextEdit (Mac)
7. Select all the text in that file (Ctrl+A / Cmd+A) and copy it (Ctrl+C / Cmd+C)
8. Go back to the Apps Script tab and paste (Ctrl+V / Cmd+V)
9. Now rename this file: double-click **Code.gs** in the left sidebar, type **Menu** and press Enter

> **The name must be exactly:**
> `Menu` — no spaces, no .gs extension needed, capital M

3 Add the DailyReport.gs file

10. Click the **+ icon next to "Files"** in the left sidebar
11. Select **Script**
12. A new file appears — immediately type **DailyReport** and press Enter
13. Open the downloaded **DailyReport.gs** file on your computer with Notepad / TextEdit
14. Select all → copy → paste into the new Apps Script file
15. Click the **Save** icon (or Ctrl+S / Cmd+S)

> **After this step your left sidebar should show:**

`Menu` and `DailyReport` — both with a .gs icon

PART B — Adding the HTML Files

You have four HTML files. These cannot be pasted directly — you first upload them to Google Drive as plain text, then create an HTML file in Apps Script and paste the code in. Follow these steps for EACH of the four files.

The four HTML files are:

- `DailySetup.html`
- `DailyControl.html`
- `DailyCharts.html`
- `DailyEmailTemplate.html`

Repeat ALL steps below for each of the 4 HTML files

The process is identical for all four. Just swap the file name each time.

1 Upload the HTML file to Google Drive as a text file

16. Go to drive.google.com
17. Click **+ New** (top-left button) → select **File upload**
18. Find and select the **DailySetup.html** file on your computer and click Open
19. The file uploads and appears in your Google Drive

What this does

Uploading the file to Drive lets you open it in Google Drive's viewer and see the raw HTML code — which you will copy in the next step.

2 Open the uploaded file and copy all the code

20. In Google Drive, find the uploaded file **DailySetup.html**
21. Double-click it — it will open in Google Drive's file viewer/preview. You should see the raw HTML code.
22. Click **Open with** → **Google Docs** (or right-click the file → Open with → Google Docs)
23. Once it opens in Google Docs, click anywhere in the document and press **Ctrl+A / Cmd+A** to select all
24. Press **Ctrl+C / Cmd+C** to copy everything

> ⚠ **Important**
> Make sure you copy the ENTIRE file from top to bottom. It starts with <!DOCTYPE html> and ends with </html>. If you miss any part the dialog will not display correctly.

3 Create an HTML file in Apps Script and paste the code

25. Go back to your Apps Script editor tab (the one with Menu and DailyReport)
26. Click the **+ icon next to "Files"** in the left sidebar
27. This time select **HTML** (not Script)
28. A new file appears — immediately type the name **DailySetup** and press Enter
29. The editor opens a blank HTML template. Delete everything inside it
30. Paste your copied code with **Ctrl+V / Cmd+V**
31. Click **Save** (Ctrl+S / Cmd+S)

> ⚠ **The name must match exactly — no .html extension**
> Type just the name, not the extension. Apps Script adds the .html automatically:

File on your computer	Name it THIS in Apps Script
`DailySetup.html`	**`DailySetup`**
`DailyControl.html`	**`DailyControl`**
`DailyCharts.html`	**`DailyCharts`**
`DailyEmailTemplate.html`	**`DailyEmailTemplate`**

4 Repeat for all 4 HTML files

Go back to Step 1 of Part B and do the same process for the remaining three files:

- **`DailyControl.html`** → name it **`DailyControl`**
- **`DailyCharts.html`** → name it **`DailyCharts`**
- **`DailyEmailTemplate.html`** → name it **`DailyEmailTemplate`**

PART C — Verify Everything & Run

1 Check your file list

In the Apps Script left sidebar you should now see exactly 6 files:

File name	Type
`Menu`	.gs (Script)
`DailyReport`	.gs (Script)
`DailySetup`	.html

`DailyControl`	.html
`DailyCharts`	.html
`DailyEmailTemplate`	.html

If any file is missing, go back and add it before continuing.

2 Save and reload the spreadsheet

32. Press **Ctrl+S / Cmd+S** to save all files in Apps Script
33. Close the Apps Script tab
34. Go back to your Google Sheet and refresh the page (F5 / Cmd+R)
35. After a few seconds, a new menu **Daily Revenue Report** will appear in the top menu bar

> **Don't see the menu?**
> Wait 10 seconds and refresh again. If it still doesn't appear, double-check that Menu.gs is saved and that the file name is exactly "Menu" with no extra spaces.

3 Accept Google's security permission (one time only)

36. Click **Daily Revenue Report** → **Setup / Control Panel**
37. A permissions dialog will appear — this is Google asking you to authorise the script
38. Click **"Review permissions"**
39. Select your Google account
40. Click **"Advanced"** then **"Go to [your project name] (unsafe)"**
41. Click **"Allow"**

> **Why Google shows this warning**
> The "unsafe" label appears on ANY personal Apps Script project that has not been through Google's paid review process. It does NOT mean the code is harmful. This is your own code running in your own account.

4 Run the Setup form

42. The **Setup / Control Panel** window opens automatically after permissions
43. Enter your sheet name, column names, email address, and delivery time
44. Click **"Save & Schedule"**
45. You will receive a test email within a few minutes to confirm everything works

> **That's it!**
> From this point the script runs every day at the time you set — no computer needs to be on, no action needed from you.

No risk. No complexity.

No coding needed	No subscriptions	No third-party tools	No data leaving Google

Everything runs inside your own Google account. Your data stays yours.

Who this is for

- Small business owners
- Online sellers (Shopify, Etsy, etc.)
- Freelancers tracking income
- E-commerce store managers
- Anyone using Google Sheets for revenue
- People who hate manual reporting

Common concerns — answered

"I'm not technical."

You paste the code, fill in a form, click save. That's the whole process. No coding, no terminal, no configuration files.

"My spreadsheet looks different."

You choose your own column names during setup. The tool adapts to however your sheet is structured.

"I don't track returns."

No problem. Just type "No" in the Return Column field during setup. The feature is completely optional.

"What if something breaks?"

The built-in System Status screen shows any errors instantly. You can also send yourself a test report at any time from the Control Panel.

"Will it stop if I close my laptop?"

No. The trigger runs on Google's servers — your computer doesn't need to be on at all. Set it once and it runs forever.

"Is my data safe?"

Completely. The script only reads your sheet and sends emails to the addresses you set. Nothing goes to any outside server. It all stays in your Google account.

Proven & reliable

- Handles thousands of rows without slowing down
- Automatically processes refunds & returns
- Sends reports daily without fail
- Built-in error handling & validation
- System status screen for instant diagnostics
- Tested on real business data

Price: FREE — for now

No catch. No upsell. No credit card.

If this saves you even 10 minutes a day — that's hours every month.

Start using it now

Stop digging through spreadsheets. Start making decisions.

Download for free and get your first report tomorrow morning.

Get Instant Access — FREE | Set up in 10 minutes | Runs forever

Feedback & Support

This tool is completely free and I want it to keep getting better. If you:

- Found a bug or something isn't working
- Have an idea for a new feature
- Want to share how it helped your business
- Have a question not covered in this guide

Send an honest email to: **htoopyae0309@gmail.com**

Honest feedback is always welcome — good or bad. It helps make this better for everyone.
